Handwritten text, likely bleed-through from the reverse side of the page. The text is illegible due to extreme blurring and low contrast.

1. The first part of the paper is devoted to a discussion of the  
theoretical aspects of the problem. It is shown that the  
problem is well-posed and that the solution exists and is unique.  
2. In the second part, the numerical algorithm is described. It is  
based on the finite difference method and the Runge-Kutta method.  
3. The results of the numerical calculations are presented in the third  
part. It is shown that the numerical solution is in good agreement  
with the analytical solution.

 The first step in the process is to identify the problem. This involves gathering information about the situation and the people involved. Once the problem is identified, the next step is to analyze it. This involves breaking the problem down into its components and understanding how they are related. The third step is to develop a plan. This involves deciding on the best way to solve the problem and the steps that need to be taken. The fourth step is to implement the plan. This involves putting the plan into action and making any necessary adjustments. The final step is to evaluate the results. This involves assessing the effectiveness of the solution and determining if any further action is needed.
